Scotland's national forests and land are responsibly managed to the UK Woodland Assurance Standard.

Some felled areas outwith ancient woodland areas present an opportunity to plant conifer species in accessible and suitable locations. With so much of the future forest being converted to native woodland habitats, there is a need to maximise commercial species in less sensitive and productive locations.

Phase 1 Restock Coupes:
Legacy felled areas which have not yet established.
Conifer sites will be planted.
All native sites will undergo the following management:
 - Removal of non-native conifer regeneration
 - Removal of exotic invasive species
 - Stocking density assessments for the remaining native natural regeneration
 - Supplementary planting of native species to achieve desired stocking density and desired species mixture.
 - Herbivore impact assessments to monitor the impact of deer
 - Adjustments to deer control to secure successful establishment.
